

Come in and welcome to 1st class

Kubicek are dedicated to serving the ballooning world by listening to our customers and improving our products. One of the greatest hazards in flying passengers is getting the less athletic into the basket. Passengers don't expect to climb over

the side of the bus before being driven into town so why do we expect them to climb up the basket before going for a balloon flight? A door is the answer.

1. A door in the 'upper' compartments gives easy access and is firmly locked shut in flight.
2. Colour coded internal rope handles make briefing passengers easier.
3. Lifting handles at mid basket height reduce back problems on the rare occasion that the basket has to be carried.
4. Pulpit rails improve security for the pilot and look ever-so-pretty.
5. Padding above and behind the handles reduce the number of bruised knuckles.

6. Burner frames that are solid enough for the ride business but designed to bend and not fail if there is an accident.
7. Substantial baskets with solid floors that are designed to be worked hard.
8. Substantial leather leggings designed to protect hoses and passengers.
9. Ignis triple and quad burners. Putting the fire where you want it.

Lots more extras to make your basket exactly what you and your customers want – at a price that will not break the bank.
